

## Instructions of **VIRESCO® Pratens** for Gardening

The seed is a live material. Its growth depends on various factors: the climate, the irrigation, the type of soil, etc. We suggest to lay down **VIRESCO®** when the temperature is steadily higher than 8°-10°C and lower than 30°C. We also kindly suggest you to follow the usage instructions listed below. We use only first grade components, yet it is not possible to guarantee a good result when inclement weather conditions occur, due to usage mistakes or during the grass cover on critical conditions.

- Lay down the pre-sowed bio-textile **VIRESCO®** when the ambient temperature is between 10°C and 30°C.
  - Prepare the ground removing the weeds by the roots, turning up the soil surface (5-8 cm) and levelling the soil.
  - On poor substrates, backfill with fertile vegetable soil (just a few centimetres).
  - Unroll **VIRESCO®** in a place with a good exposure to light, even if shaded. Do not stretch or pull the felt, but lay it down making it adhere thoroughly to the ground. The overlap (edge to edge) between rolls is not recommended.
  - It can be easily cut and shaped using simple domestic scissors.
  - Water daily until the grass surface has completely emerged (first species after 7-10 days, the latest ones after 25- 30 days), even more often when the product is laid on very steep surfaces.
  - When a regular watering is not possible, we suggest to cover **VIRESCO®** with a few millimetres of loam and water it every 1-2 days.
  - After approx. one month, irrigate according to the soil needs.
  - Afterwards, take care of the lawn as usual (trampling and mowing are allowed).
  - Cut it for the first time when it reaches 10-15 cm and not less than 5 cm.
- 
- About the **BLOOMY LAWN** our mixtures are a mix of annual and perennial species.
  - The annual species will flourish in the first vegetative year, the perennials in the second vegetative year.
  - Do not cut before the first flowering and no more than twice per year to a height of not less than 10 cm.
  - On slopes or in windy conditions it is advisable to anchor **VIRESCO®** using pegs or light U-shaped iron staples.
- 
- **VIRESCO®** may be laid down on both sides.

**VIRESCO® is a totally natural product, 100% biodegradable in a period which can vary from three to four months, depending on the ground type and on the environmental and climatic conditions.**

**If stocked in a dry place inside its nylon packaging, the product life is longer than one year.**
